

ABSTRACT OF THE DISCLOSURE

5 An interconnecting container assembly includes a plurality of hollow  
containers aligned along a common axis where each container includes a  
threaded opening on a first end and a threaded recess on a second end. A  
removable dispensing cap matingly engages the threaded opening on at least  
one of the plurality of hollow containers. Alternatively, the interconnecting  
container assembly includes a plurality of hollow containers aligned end-to-end  
10 along a common axis where each container includes a threaded dispensing cap  
on a first end and a threaded recess on a second end. The threaded dispensing  
cap on at least one of the plurality of hollow containers matingly engages the  
threaded recess of one of the remaining plurality of hollow containers.
